

Git Workflow - CMD

1. Get Master: `git clone <repo_url>.git`
2. Change to your new directory
3. Check your status: `git status`
4. Make your modifications on your computer
5. Stage your changes: `git add <files>`
6. Check your status: `git status`
7. Commit your changes **locally**: `git commit -m "your commit message"`
8. Check your status – it should say origin is ahead of master: `git status`
9. Send your changes to remote: `git push origin master`
